

Challenge

TASK

You received a written discussion about innovative project(s) which should be handed in to the tax R&D subsidy grant scheme in Germany. The prerequisite for this is that the project is innovative according to the FRASCATI handbook. Please find an attached example of a project draft which has been granted.

Your job is to translate (**chatgpt or deepL**) split this document into meaningful pieces and write one or several projects which need to:

1. Follow EXACTLY the given outline in the project example. The document is called "Target example". The Structure of the document has to be the same as the example. This means, that it has to be a word document with the same structure. The only thing that needs to be changed from your side is the content. NOTE: If the document is not a word + does not follow the given structure it will be considered as failed immediately.
2. SATISFY Frascati criteria of innovation, technical risk and uncertainty as well as giving specific target parameters in form of absolute values. Also give a comparison to the state of the Art and serve as project target values.
3. Use the given structure in the project handbook. It is important that you fullfill all the given requirements in the handbook.
4. The written project has to be in German. This is crucial. Please pay attention to the translation.
5. The main purpose of this hackathon is to show how well you can write projects with the help of ChatGPT. Please make sure that you and ChatGPT work together and write a perfect project text.

Don't forget to look at the attached files for the related documents!
